HEDGING ANALYSIS

Simulated Price **\$396.00**

Regime **+ γ**

Distance to Flip **+24.76**

Total GEX at Price **+\$1.65B**

DEALER HEDGE FLOW

\$↑ \$1: **Sell 4.1K shares**

\$↓ \$1: **Buy 4.1K shares**

MM is **short γ (always)**. In + γ zone, hedging **compresses moves** — price gets pinned toward \$397.5 between walls.

NEAREST LEVELS

↑ Nearest Resistance **Call Wall \$400**

↓ Nearest Support **Put Wall \$395**

Range Width

\$5.00

Vanna Exposure

$\partial^2 V / \partial S \partial \sigma$

Dealer's delta sensitivity to IV changes. **When IV drops, vanna flows trigger systematic buying** as dealers reduce hedges. Critical near OPEX.

Current Vanna Flow

+POS • IV ↓ → Bid

Charm Exposure

$\partial \Delta / \partial t$

Delta decay over time. **Drives the OPEX week run-up pattern** — as expiration nears, OTM call deltas decay, forcing dealers to unwind short hedges by buying.

Current Charm Flow

+POS • Time Decay Bid
